

Getting Ready

Think of some examples of angles that can be found in your school, your home, in other buildings, or outside. Give at least one example of each type of angle described.

- An angle that occurs as the result of a *turning motion*, such as the opening of a door
- An angle that occurs as a *wedge*, such as a slice of pizza
- An angle that occurs as *two rays with a common vertex*, such as the branches on a tree

How could you compare the size of these angles?
